  "severity": "MEDIUM",
  "risk_score": 35,
  "playbook": "NOTIFY_ANALYST",
  "source_ip": "75.24.108.158",
  "target": "/prod/python",
  "event_count": 20,
  "human_review_required": true,
  "containment_performed": false,
  "analyst_summary": "# Incident Response Summary\n\n**Incident Title:**\nConcentrated WAF Block Activity from Single Source IP Against /prod/python Endpoint\n\n**SOC Alert:**\nOn 2026-07-23 between 20:44:42 and 20:56:41 UTC, the IP address 75.24.108.158 generated 20 requests to the `/prod/python` endpoint. All 20 requests were blocked by the AWSManagedRulesCommonRuleSet WAF rule. The activity originated from a single source IP, targeted a single URI, and triggered one rule type. No requests reached the backend application.\n\n**Manager Summary:**\nA concentrated pattern of blocked requests has been detected and requires analyst review to determine root cause. The WAF performed as designed by blocking all requests; however, the repetitive nature and narrow scope warrant investigation to distinguish between legitimate misconfiguration and reconnaissance activity. No successful breaches or data exposure has occurred. Severity is MEDIUM (Risk Score: 35) due to the limited scope and 100% block rate.\n\n**Analyst Investigation Checklist:**\n- [ ] Query threat intelligence feeds for IP reputation of 75.24.108.158\n- [ ] Check internal asset inventory to determine if this IP is owned by the organization or a known partner\n- [ ] Review WAF logs to identify the specific rule violation patterns (e.g., SQL injection, XSS, path traversal signatures)\n- [ ] Examine application logs to confirm requests did not reach the backend\n- [ ] Verify whether `/prod/python` is a sensitive endpoint or contains production data\n- [ ] Establish historical baseline: has this source IP generated traffic before? Are there pattern changes?\n- [ ] If internal/partner-owned, contact the source owner to verify legitimate use or identify misconfiguration\n- [ ] Set monitoring alert for activity resumption from this source IP\n\n**Why This Playbook Was Selected:**\nThe NOTIFY_ANALYST playbook was selected because the finding requires human judgment to determine intent. The evidence shows a factual pattern (20 blocked requests, single source, single URI) but does not prove malicious intent. The activity could represent automated client retry logic, misconfigured integration, vulnerability scanning, or reconnaissance. Only an analyst can correlate this finding with threat intelligence, internal asset data, and application context to reach a justified conclusion.\n\n**Limitations and Unknowns:**\n- **Source intent unknown:** The blocked requests could represent legitimate misconfigured automation, developer testing, or deliberate probing. Evidence alone does not distinguish between these scenarios.\n- **Request payload details unavailable:** The specific rule violations (SQL injection, XSS, path traversal, etc.) are not provided in this summary and must be reviewed in WAF logs.\n- **Source ownership unclear:** The IP geolocation is United States, but internal ownership or partnership status is unknown without asset inventory correlation.\n- **Endpoint sensitivity unconfirmed:** The business criticality and data sensitivity of `/prod/python` is not specified.\n- **Historical context missing:** No baseline data on this source IP's previous activity patterns is available.\n- **A human analyst must review this finding before any containment actions are taken.**"
